                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A compsn. which induces a cytotoxic T lymphocyte (CTL) response to an antigen (Ag) in a mammal comprises, a CTL Ag response inducing peptide (i.e. AAR78824 R78853) and a lipid conjugated helper T cell inducing peptide. The compsn. induces a CTL response to bacterial, viral or tumour Ags, and is therefore useful in the treatment and prevention of diseases associated with the Ag.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Compsn. inducing cytotoxic T lymphocyte response to pref. viral, bacterial, parasitic or tumour antigens - useful in the treatment and prevention of diseases associated with the antigen e.g. hepatitis B

                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Potential P.falciparum HLA epitopes are peptides derived from antiqens shown to be targets of CTL recognition and which are capable of binding with high affinity to a specified HLA class 1 molecule. Although they have not been shown to be recognised by CTL grown from malaria-exposed individuals their ability to bind to the relevant class 1 molecule indicates that they are likely to be presented on the surface of malaria-infected hepatocytes in vivo. The present sequence is a potential HLA-B7 epitope derived from liver-stage antignen-1. The use of this peptide (or its variants or longer peptides comprising it) as a CTL inducer for immunisation against malaria in HLA-B7 individuals is claimed.
                                                                                                                                                                                                                                                                                                                                                                                                           Liver-stage antigen; LSA-1; human leucocyte antigen; HLA; class 1; HLA-B7; potential epitope; malaria; vaccine; CTL induction;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    compositions

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to methods and reagents for generating a protective CD8+ T-cell immune response against at least one target antigen. The Kits of the invention comprises (1) as printing composition, a source of one or more CD8+ T-cell [cytotoxic T lymphocytes-(CTL)] cepitopes of the target antigen, plus a carrier and (ii) as boosting composition a source of CTL epitopes, with at least one CTL epitope the same as used in (1), with this source being a non-replicating or replication impaired recombinant poxvirus vector (FVV) plus a carrier. If the source of CTL epitopes in (i) is a viral vector, then the vector in (ii) is from a different virus. The kits are used to generate an immune (ii) is from a different virus. The kits are used to generate an immune specifically against malaria parasites such as P. falciparum, or HIV, and also many other bacterial, viral or parasitic pathogens or tumours, specifically against malaria parasites against melanoma and cancer of breast or colon, and generally wherever a strong CD8+ response is protective. The boosting composition may be used alone to boost a naturally primed response against malaria. The specified PVV provide an excellent booster effect, better than half from wild-type poxvirus, resulting in complete cather than partial protection against sporozoite challenge. Also PVV are affect, the na wild-type poxvirus, resulting in complete
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     peptide containing a CTL (cytotoxic T lymphocyte) epitope recognised by cytotoxic T cells and a protein containing the ATPase domain of a heat shock protein. Also described are: (1) a drug composition containing (I) as active ingredient; (2) a DNA encoding (I); (3) an expression vector containing the DNA of (2); and (4) a transformant which can retain the expression vector of (3). (I) has cytostatic, immunostimulant and protozoacide activities, and can be used as a cellular immune response inducer. The protein is useful as an active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against leukaemia. The present sequence regereseits a specifically claimed CTL epitope for use in a fused protein of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fused protein capable of inducing cellular immune response, useful as active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Recombinant protein; CDC/NIIMALVAC-1; multivalent; malaria; vaccine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Dρ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 δŏ
                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the antigenic epitope P595, derived from
liver stage antigen-1 (LSA-1) of Plasmodium falciparum. It is used
liver stage antigen-1 (LSA-1) of Plasmodium falciparum. It is used
in the construction of recombinant protein CONIMALVAC-1, which
antificable in unitistage malarial vaccine. The recombinant
protein comprises, melittin signal Peptide, (His)6 tag,
corollar protein (CSP), sporozoite surface protein-2 (SSP-2),
circumsporozoite protein (CSP), sporozoite surface protein-1 (MSP-1),
liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1),
liver stage antigen-1 (LSA-1), merozoite surface protein-1
(MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175
(MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175
(MSP-179), rhopty associated protein-1 (AMA-1) and gamete specific
antigen, Pfg27. These epitopes were obtained at different stages of the
antigen, Pfg27. These epitopes were obtained at different stages of the
antigen, Pfg27. These epitopes were obtained at different stages of the
cativity and can used for treatment and prevention of malarial
confections. Anti-CDC/NIMALVAC-1 antibodies can be used for detecting
confections. Anti-CDC/NIMALVAC-1 antibodies can be used for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CD8+ T-cell; immune response; antigen; priming composition; CTL; epitope; cytotoxic I lymphocyte; boosting; poxxirus vector; PVV; pathogen; tumour; malaria; parasite; P. falciparum; viral; bacterial; parasitic; cancer; melanoma; HIV; breast; colon; vaccination.

The invention relates to methods and reagents for generating a protective CC CD8+ T-cell immune response against at least one target antigen. The kits CD8+ T-cell (syttoxic T lymphocytes-(CTL)) epitopes of the target antigen, plus a carrier and (li) as boosting composition, a source of one or antigen, plus a carrier and (li) as boosting composition a source of CTL epitope the same as used in (li), with this source being a non-replicating or replication-impaired recombinant this source being a non-replicating or replication-impaired recombinant comparisons viral vector (PVV) plus a carrier. If the source of CTL epitopes in povavirus vector (PVV) plus a carrier. If the source of CTL epitopes in comparisons the strict are used to generate an immune response (prophylactic or the rapeutic) against pathogens or fumours, specifically against malaria creaspines against melanoma and cancer of breast or colon, and generally response against melanoma and cancer of breast or colon, and generally wherever a strong CD8+ response is protective. The boosting composition wherever a strong CD8+ response is protective. The boosting composition complete rather than that from wild-type poxvirus, resulting in complete rather than partial contains and contains against melanome and contains and contains against melanome and exceptive. The boosting composition complete rather than partial and contains and conta

The polypeptide can be used in the preparation of vaccines against malaria.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;
                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), inver stage antigenic (SSP, sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), thopits associated protein-1 (RAP-1) and gamete specific antigen, Ffg27. These epitopes were obtained at different stages of the life cycle of Plasmodium falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.

AAHS5304 to AAHS3970 represent nucleic acids (I) encoding polypeptides CC (II), given in AAG81454 to AAG8120, from Staphylococcus epidermidis. (II), given in AAG81454 to AAG8120, from Staphylococcus epidermidis. CC (II) and (II) can have antibacterial activity and therefore can be used to in vaccination. The nucleic acids (II) may be used to produce the containing them which are used to produce hosts cells which express the containing them which are used to produce acids) may then be collapseptides. The polypeptides (II) (and/or incleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the AAHS5090 represent specifically claimed s. epidermidis genomic DNA AAHS5090 represent specifically claimed s. epidermidis genomic DNA AAHS5090 represent oligourcleotide sequences and primers which are used in the exemplification of the present invention. AAHS5091 to sequence listing of the present specification, however the sequence listing of the present specification, however the sequence listing of the present specification, however the sequence listing of the present specification, chowever the sequences are given in the disclosure for SEQ ID NO:4455 to 4472, on sequences are present for SEQ ID NO:4455 to 4472, on sequences are present for SEQ ID NO:4455 to 4472,
                                                                                                                 ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (I), given in AAG81454 to AAG81120, from Staphylococcus epidermidis.

(II), given in AAG81454 to AAG81120, from Staphylococcus epidermidis.

(I) and (II) can have antibacterial activity and therefore can be used (I) and (II) can have nucleic acids (I) way be used to produce the containing them which are used to produce hosts cells which express the containing them which are used to produce hosts cells which express the polypeptides (II) (and/or nucleic acids) may then be contained to accinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the transment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH5509 represent specifically claimed S. epidermidis genomic DNA AAH5509 represent oligourcleotide sequences and primers which are used in the exemplification of the present invention. AAH55091 to sequence listing of the present specification, conceaved the present specification of the present invention.

Sequences given in the sequence listing of the present specification, however the sequence listing of the present specification, conceaved the sequence listing of the present specification, however the sequence listing of the present specification, conceaved the sequence listing of the present specification, conceaved the sequence listing of the present specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

APPLICANT: Adrian V.S. Hill, et al.
TITLE OF INVENTION: PLASMODIUM FALCIPARUM MHC CLASS I-
TITLE OF INVENTION: RESTRICTED CT.L EPITOPES DERIVED FROM PRE-ERYTHROCYTIC STAGE
TITLE OF INVENTION: ANTIGENS (AS AMENDED)
NUMBER OF SEQUENCES: 86
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

Patent No. 6228922

GENERAL INFORMATION:
APPLICANT: USESEN, HOLLY J
APPLICANT: MEYER, TERRY E
TITLE OF INVENTION: GENES AND METHODS FOR CONTROL OF
TITLE OF INVENTION: NEMATODES IN PLANTS
NUMBER OF SEQUENCES: 10
CORRESPONDENCE ADDRESS:
ADDRESSEE: W. MATTAY Spruill (Alston & Bird, LLP)
STREET: Railegh
CITY: Railegh

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -i- FUNCTION: CATALYZES THE REVERSIBLE ADENYLATION OF NICOTINATE MONONUCLECATIDE (BY SIMILARITY).
-i- CATALYTIC ACTIVITY: ATP + NICOTINATE RIBONUCLEOTIDE = DIPHOSPHATE + DEAMIDO-NAC!+).
-i- PATHWAY: DE NOVO BIOSYNTHESIS OF NAD.
-i- SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE NADD FAMILY.
-i- SIMILARITY: IN THE C-TERMINAL SECTION; BELONGS TO THE YORO FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          20-AUG-2001 (Rel. 40, Created)

-1- FUNCTION: TYROSINE KINASE OF THE NON-RECEPTOR TYPE, INVOLVED IN THE IFN-ALPHA/BETA/GAWMA SIGNAL PATHWAY. KINASE PARTNER FOR THE INTERLEUKIN (1L)-2 RECEPTOR (BY SIMILARITY).

-1- CATALITIC ACTIVITY: APP + A PROTEIN TYROSINE - ADP + PROTEIN TYROSINE PHOSPHATE.

-1- SUBCELLULAR LOCATION: WHOLLY INTRACELLULAR, POSSIBLY MEMBRANE ASSCIATED (BY SIMILARITY).

-1- DOMAIN: POSSESSES TWO PHOSPHOTRANSFERASE DOMAINS. THE SECOND ONE PROBABLY CONTAINS THE CATALITIC DOMAIN (BY SIMILARITY), WHILE THE PROBABLY CONTAINS THE CATALITIC DOMAIN (BY SIMILARITY).
TYROSINE-PROTEIN KINASE JAKI (EC 2.7.1.112) (JANUS KINASE 1) (JAK-1).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Description

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The peptides AAW54559-W54809 are examples of peptides to which at least 1 (preferably 2) mannose can be attached to increase their uptake as antigens by antigen-presenting cells. Uptake of agonist mannosylated peptides by a considerable of a cell response, whereas uptake of antagonist peptides will increase the T cell response, whereas uptake of antagonist autoantigens can be used in treatment of type I diabetes, rheumatoid arthritis, graft rejection etc., also to induce T cell nor responsiveness. Vaccines containing mannosylated antigen are used to prevent or treat infections by, e.g. bacteria, viruses, fungi, helminths and parasites.
                                                                                                                                                                                           Mannose; antigen; antigen-presenting cell; mannosylated peptide; {\tt T} cell; vaccine; treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Increasing uptake and presentation of antigen(s) - by adding mannose residue(s) to antigen for increasing T cell response, useful in, e.g. vaccines against viral infection(s)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0;

                               The sequence is that of peptide ls8 which is recognised by, or can induce, cytotoxic T lymphocytes. It may be useful in vaccines against malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A compsn. which induces a cytotoxic T lymphocyte (CTL) response to an antiquen (Ag) in a mammal comprises, a CTL Ag response inducing peptide (i.e. AAR7884-R78853) and a lipid conjugated helper T cell inducing peptide. The compsn. induces a CTL response to bacterial, viral or tumour Ags, and is therefore useful in the treatment and prevention of diseases associated with the Ag.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Compsn. inducing cytotoxic T lymphocyte response to pref. viral, bacterial, parasitic or tumour antigens - useful in the treatment and prevention of diseases associated with the antigen e.g. hepatitis B

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ВÞ
                                                                                                                                                                                                                                                                                                                             protective CD8+ T-cell immune response against at least one target antigen. The kits of the invention comprises (1) as priming composition, a source of one or more CD8+ T-cell [cyttotoxic T lymphocytes-(CTL)] cepitopes of the target antigen, plus a carrier and (ii) as boosting composition a source of CTL epitopes, with at least one CTL epitope the same as used in (1), with this source being a non-replicating or replication-impaired recombinant poxvirus vector (PVV) plus a carrier. If the source of CTL epitopes in (1) is a viral vector, then the vector in (11) is from a different virus. The kits are used to generate an immune ceponacy (prophylactic or therapeutic) against pathogens or tumours, specifically against malaria parasites such as P. falciparum, or HIV, and also many other bacterial, viral or parasitic pathogens. The kits are also used for protective response against melanoma and cancer of breast or colon, and generally wherever a strong CD8+ response is protective. CT he boosting composition may be used alone to boost a naturally primed response against malaria. The specified PVV provide an excellent booster cffect, better than that from wild-type poxvirus, resulting in complete crather than partial protection against sporozoite challenge. Also PVV are setting epitopes of the malaria (M) string.

The present invention describes a fused protein (I) prepared from a peptide containing a CTL (cytotoxic T lymphocyte) epitope recognised by yttotoxic T cells and a protein containing the Arpase domain of a heat shock protein. Also described are: (1) a drug composition containing (I) as active ingredient; (2) a DNA encoding (I); (3) an expression vector containing the DNA of (2); and (4) a transformant which can retain the expression vector of (3). (I) has cytostatic, immunostimulant and protozoacide activities, and can be used as a cellular immune response inducer. The protein is useful as an active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against leukaemia. The present sequence represents a specifically claimed CTL epitope for use in a fused protein of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Recombinant protein; CDC/NIIMALVAC-1; multivalent; malaria; vaccine; T-cell epitope; tetanus toxoid; antigenic epitope; treatment; circumsporozoite protein; CSP; sporozoite surface protein-1; SSP-2; liver stage antigen-1; LSA-1; merozoite surface protein-1; MSP-1; mSP-2; apical membrane antigen-1; AMA-1; erythrocyte binding antigen-175; EBA-175; rhoptry associated protein-1; RAP-1; gamete specific antigen; Pfg27; antiparasitic; prevention; anti-CDC/NIIMALVAC-1 antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Fused protein capable of inducing cellular immune response, useful as active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to methods and reagents for generating a protective CD8+ T-cell immune response against at least one target antigen. The kits of the invention comprises (1) as priming composition, a source of one or more CD8+ T-cell (cyctoxic T lymphocytes-(CTL)) epitopes of the target antigen, plus a carrier and (ii) as boosting composition a source of CTL epitopes, with at least one CTL epitope the same as used in (1), with capture post proceeding a non-replicating or replication-impaired recombinant povarius vector (PVV) plus a carrier of the source of CTL epitopes in (i) is a vizal vector, then the vector in (ii) is from a different virus. The kits are used to generate an immune response (prophylactic or therapeutic) against pathogens or tumours, specifically against malaria parasites such as P. falciparum, or HIV, and also many other bacterial, carponse against melanoma and cancer of breast or colon, and generally response against melanoma and cancer of breast or colon, and generally merever a strong CD8+ response is protective. The boosting composition may be used alone to boost a naturally primed response against malaria. The specified PVV provide an excellent booster effect, better than that confid-type poxvirus, resulting in complete rather than partial protection against sporozoite challenge. Also PVV are safer to use than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

It is used in the construction of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (H185) 6 tag.

T-cell epitope from tetanus toxoid and 21 antigenic epitopes from clircumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), Hive stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27, These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial frections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CD8+ T-cell; immune response; antigen; priming composition; CTL; epitope; cytotoxic T lymphocyte; boosting; poxvirus vector; PVV; pathogen; tumour; malaria; parasite; P. falciparum; viral; bacterial; parasitic; cancer; melanoma; HIV; breast; colon; vaccination.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (RAP-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Fig27. These epitopes were obtained at different stages of the life cycle of altsmodium falciparum CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

AND ANUL4602-ANUL4794 represent novel bone marrow polypeptides of the invention. The proteins and corresponding coding sequences may be used in the prevention, diagnosis and treatment of diseases associated with cinappropriate bone marrow polypeptide expression. For example, to treat disorders associated with decreased expression by rectifying mutations core depetions in a patient's genome that affect the activity of the polypeptides by expressing inactive proteins or to supplement the patient's own production of the polypeptides. Additionally, the nucleic acids may be used to produce the polypeptides, by inserting the nucleic acids may be used to produce the polypeptides, by inserting the nucleic acids and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and therefore which patients and in assays to dientify modulators of their expression and activity.

The anti-bone marrow protein antibodies and antagonists may also be used as and an assays to identify modulators of their expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of the protein is amples.

Co down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of the protein is amples.

Co down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of the protein is amples.

Co down regulate haematopoiesis activity, and consequently in the treatment of myelold or lymph cell disorders; in tissue regeneration, and be used to regulate haematopoiesis activity, and consequently in the treatment of myelold or lymph cell disorders; in tissue regeneration, and activity as an untititional supplement, and in treatment of immune disorders such as severe combined immunodeficiency (SCID).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence,
